Study Session

## Item -4

### Discussion Concerning South Grand Island Water Contamination Problem

*Initial analysis of water samples tested by the state lab have shown numerous high to very high readings on VOC contamination in the Mary Lane area of southwest Grand Island. This street, while in the city limits, does not have a city water line. Making city water available to these homes seems to be the only viable means to assure them of a safe source of water, not just for drinking, but for bathing and other usage as well. Staff will present to council options that could be implemented to bring city water to these residents.*
